

Natural gas costs this much to produce electricity.

When it comes to keeping energy affordable, all fuels are not created equal. Generating electricity with natural gas costs three times more than power generated using American coal. And historically, natural gas prices are far more volatile than the stable cost of coal.

Coal's low cost goes a long way toward providing the affordable energy American families rely on each day to meet nearly half of their electricity needs. Moreover, affordable electricity from coal helps to keep businesses competitive and creates jobs for American workers.
